PROBABLISTIC models play a key role in the modeling, analysis, control, and performance evaluation of a broad range of real-life systems. Furthermore, technological developments and paradigm shifts continually call for updating and adapting existing models.

Telecommunication networks constitute a fundamental case in point; traffic modeling and teletraffic analysis have long been basic to their modeling, analysis, and evaluation of performance measures. For over a decade this area has been undergoing extraordinarily rapid development and technological change. Consequently, the qualitative and quantitative expansion of services carried, or planned to be carried, has rendered the bulk of traditional teletraffic analysis methodologies unsuitable for modeling emerging complex high-speed networks. The problems lie primarily in the bursty nature of new traffic classes, such as compressed video and file transfer. The former class is especially troublesome as it combines strict timeliness constraints and high traffic volumes. While the phenomenon of burstiness is underpinned mathematically by autocorrelations in traffic streams, traditional analysis relies heavily on independence assumptions for the majority of tractable solutions. On the other hand, when models incorporate traffic dependencies, the resultant models are complex and afford no systematic way of mapping empirical measurements into working models.

The effective design and engineering of networks requires accurate mathematical models which capture the important statistical properties of traffic sources. The paper by Melamed and Pendarakis provides a general methodology for constructing Markovian models of compressed variable bit rate (VBR) video. The modeling framework is based on the extension of transform-expand-sample (TES) processes which simultaneously capture the marginal density and correlation structure of traffic. The paper by Che and Li uses models based on circulant modulated rate processes for this same purpose. Once accurate mathematical models of traffic are constructed, a network designer may use them in either a Monte Carlo simulation or in analysis. Many papers in this issue are concerned with efficient computational algorithms of teletraffic models. In most cases where an exact analysis is possible, the underlying processes are Markovian. Therefore, efficient and robust numerical methodologies are essential for the computational aspects of such models.

The paper by Akar et al. presents a new algorithmic solution for M/G/1-type Markov chains. Such chains frequently appear in the teletraffic analysis of modern telecommunications networks, e.g., ATM. Known concepts from classical system and control theory are borrowed in their numerical algorithms, and both infinite and finite chains are considered. The paper by Jean-Marie et al. provides a new computational algorithm for the workload distribution in the MMPP/GI/1 queueing system. This approach provides special attention to situations where the input process consists of superposition of independent processes. The MMPP/GI/1 model is frequently used in the teletraffic analysis of a single node modern network. The paper by Lenzini et al. provides an efficient numerical method for a class of finite, discrete-time, discrete-state Markov chains with special (funnel) structure. An extension of the packet reservation multiple access (PRMA) protocol was analyzed using this approach. Borst and Mitra provide a computational algorithm for sharing of resources among heterogeneous traffic sources.

In the area of quality of service guarantees in high-speed networks, one can identify probabilistic (soft) guarantees and deterministic (hard) guarantees. Two of the papers in this issue deal with probabilistic guarantees. The first, by Ren and Kobayashi, considers the issue of bandwidth allocation by concentrating on a single node. The traffic is assumed to be the superposition of Markov modulated rate processes (MMRP). Applications in real-time admission control, as well as an extension of this model for the characterization of long-range dependency, are discussed. The second paper, by Mitra et al., considers a single node environment where the problem of call admission control (CAC) is addressed at both cell and call levels. The issue of deterministic guarantee in a multiple node environment is addressed by Chang; the existing definition of burstiness constraint, as well as the concept of service curve, are generalized to a matrix setting, and parallel results to the scalar case are developed for the matrix case.

Certain recent measurements of local area networks (LAN’s) traffic and VBR compressed video traffic reveal long-range dependency (LRD) and self-similarity. The paper by Andersen and Nielsen presents a Markovian approach for approximating arrival processes with the above-mentioned properties. Krunz and Makowski revisit the modeling of VBR video traffic and show evidence that neither LRD nor Markovian models may accurately capture the correlation structure of data. They use the M/G/\infty model for a number of video traces to make their point. The paper by Boxma and Cohen examines the impact of service time distribution on performance through an analysis of the classical M/G/1 queueing system with heavy-tailed service time distribution. As a means of congestion avoidance, one may selectively discard packets in network buffers. Lapid et al. provide an analysis of various discarding policies. The paper by Altman...
and Jean-Marie gives some statistical properties of the loss process in finite buffers.

Two articles in this issue focus on the teletraffic analysis of wireless cellular networks. Orlik and Rappaport analyze the channel holding time under general session and dwell time distribution. Tutschku and Tran-Gia deal with mobile network design issues and the problems of traffic estimation and characterization in such networks.

Due to an unusually large number of submissions (almost 100) and a limited amount of publication space, many excellent papers did not appear in this issue. It is our hope that these papers will soon appear in other issues of IEEE JOURNAL ON SELECTED AREAS IN COMMUNICATIONS or in other IEEE journals.

ACKNOWLEDGMENT

The Guest Editors would like to thank all of the authors who contributed papers to this issue, as well as the many reviewers who contributed their valuable suggestions and advice. They also thank Senior Editor N. F. Maxemchuk and the IEEE publications staff for their help and support in the publication of this issue.

Hisashi Kobayashi, Guest Editor
Princeton University
Princeton, NJ 08544-1984 USA

Guy Latouche, Guest Editor

N. F. Maxemchuk, JSAC Board Representative

Hisashi Kobayashi (S’66–M’68–SM’76–F’77) received the B.S.E. and M.S.E degrees from the University of Tokyo, Japan, in 1961 and 1963, respectively, and the Ph.D. degree from Princeton University, Princeton, NJ, in 1967, all in electrical engineering.

He was a Radar System Designer at Toshiba Electric Company, Kawasaki, Japan, from 1963 to 1965. He was with IBM T. J. Watson Research Center, Yorktown Heights, NY, from 1967 until 1986, and from 1982 to 1986 he was the Founding Director of the IBM Tokyo Research Laboratory. In 1986 he joined the faculty of Princeton University as the Sherman Fairchild University Professor of Electrical Engineering and Computer Science. From 1986 to 1991 he was Dean of Engineering and Applied Science at Princeton University. He held Visiting Professorships at University of California, Los Angeles (1969–1970), University of Hawaii, Honolulu (1975), Stanford University, CA (1976), Technical University of Darmstadt, West Germany (1979–1980), Free University of Brussels, Belgium (1980), and University of Tokyo (1991–1992). He is the inventor of a high-density magnetic recording scheme, now widely known as the PRML (partial-response coding and maximum-likelihood decoding) scheme, a co-inventor of relative address coding for image compression, and most recently, co-inventor of a new class of coding/modulation schemes termed Lego codes and Lego-coded modulation. His current research areas include architectures and performance analysis of wireless and optical networks, resource allocation and control algorithms in high-speed networks, efficient coding and modulation schemes, and teletraffic theory. He regularly teaches courses in digital communications and communication networks and is currently preparing textbooks on these subjects. He has served as a scientific advisor for many organizations, including NASA, Washington, DC, SRI International, Menlo Park, CA, the Institute of Systems Science at the National University of Singapore, the Advanced Systems Institute of British Columbia, Canada, and the Communications Research Laboratory, Ministry of Posts and Telecommunications, Japan.

Dr. Kobayashi was the recipient of the Humboldt Prize from Germany (1979), IFIP’s (International Federation of Information Processing) Silver Core Award (1980), IBM Outstanding Contribution Awards (1975 and 1984), and IBM Invention Achievement Awards (1971 and 1973). He was elected a member of the Engineering Academy of Japan (the National Academy of Engineering in Japan) in 1992.
Guy Latouche received the degree of Licencé in mathematics from the Universiti Libre de Bruxelles, Belgium, in 1968, the M.Sc. degree in mathematical statistics from Purdue University, West Lafayette, IN, in 1971, and the Ph.D. degree in mathematics from the Universiti Libre de Bruxelles in 1976.

He has held various positions at the Universiti Libre de Bruxelles, where he is currently a Professor in the Department of Informatics. Presently he teaches classes on stochastic processes and their applications. In the past he has taught classes on management information systems, as well as a course on formal methods for proving the correctness of programs. He has been a Visiting Professor at the University of Delaware, Newark, a consultant with Bellcore, and a visitor to the Teletraffic Research Center at the University of Adelaide. His research interests include various aspects of computational probability, such as matrix methods in Markov models, traffic models for telecommunication systems, and nearly completely decomposable systems.

He was a Faculty Member in the Department of Applied Mathematics and Statistics at the State University of New York at Stony Brook from 1976 to 1981. Subsequently he worked at AT&T Bell Laboratories, where he was a Distinguished Member of Technical Staff upon leaving in 1990. He has been an Adjunct Faculty Member at Columbia University and has consulted with many companies in New York. He is currently the Head of the Performance Analysis Department at C&C Laboratories, NEC USA, Princeton, NJ. His research interests include queueing theory and its applications to computer and communications problems.

Khosrow Sohraby (S’82–M’84–SM’89) received the B.Eng. and M.Eng. degrees from McGill University, Montreal, Canada, in 1979 and 1981, respectively, and the Ph.D. degree in 1985 from the University of Toronto, Canada, all in electrical engineering.

From 1984 to 1986 he was a Research Associate at L’Institute National de la Recherche Scientifique—INRS Telecommunications, Montreal, Canada. In 1986 he joined AT&T Bell Laboratories, Holmdel, NJ, as a Member of Technical Staff in the Teletraffic Theory and System Performance Analysis Department. In 1989 he joined IBM T. J. Watson Research Center, Yorktown Heights, NY, as a Research Staff Member in the Communications Systems Department. While at IBM, he was an Adjunct Faculty at Polytechnic University, Brooklyn, NY, and Columbia University, New York, in the Departments of Electrical Engineering, where he taught undergraduate and graduate courses in telecommunications. Since 1994 he has been Professor of Computer Science Telecommunications at the University of Missouri–Kansas City. In 1996 he was a Consultant to Lucent Technology, Bell Labs Innovations (formerly AT&T Bell Laboratories). He is a member of the editorial board of Computer Networks ISDN Systems, Wireless Networks Journal, International Journal of Wireless Networks, and Network Magazine.

Dr. Sohraby is an active member of the IEEE Communications Society and has served as Guest Editor for several issues of IEEE JOURNAL ON SELECTED AREAS IN COMMUNICATIONS and IEEE COMMUNICATIONS MAGAZINE. He has served on the technical program committee of many IEEE conferences and workshops. He served as the Technical Program Vice-Chair of IEEE INFOCOM ’94, the Technical Program Co-Chair of IEEE INFOCOM ’95, and the Technical Program Chair of the 10th Annual IEEE Workshop on Computer Communications.
